## EXECUTIVE SUMMARY

This report is prepared in accordance with the 2011 Arkansas Act $790^{1}$ to define Arkansas "Red Counties." Twenty-two counties were identified and ranked as "Red Counties" in 2018. This report assists the Red County Action Planning Committee in continuing interventions in the "Red Counties."

## Key Findings

- The life expectancy in Arkansas has been consistently lower than the United States (U.S.). Arkansas tied with Louisiana for $43^{\text {rd }}$ in the U.S. in life expectancy in 2010-2015 ${ }^{2}$ ( $1^{\text {st }}$ being the best).
- The 2015 and 2016 life expectancies were 76.0 and 75.8 years for Arkansas compared to the 78.7 and 78.6 years for the U.S. ${ }^{3}$, respectively. In 2016, 52 out of the $75(69 \%)$ county-specific life expectancies fell below the state's average life expectancy.
- Benton County had the highest life expectancy of 79.7 years, 3.9 years higher than the state's average, and was used as reference for comparison in this report for the 2016 life expectancy.
- Monroe County had the lowest life expectancy of 70.6 years in 2016, which is 5.2 years lower than the state's average and 9.1 years lower than Benton County's life expectancy.
- In 2016, the cut-offs generated one Gold County (79.7), 52 non-Red Counties (73.879.6), and 22 Red Counties (<73.8).
- The 22 Red Counties in 2016 were, from lowest to highest life expectancy, Monroe, Mississippi, Phillips, Desha, Poinsett, Clay, Jackson, Cross, Jefferson, Randolph, Calhoun, Bradley, Sharp, Cleveland, Chicot, Lawrence, Little River, Crittenden, Nevada, Ouachita, Hot Spring, and Howard.
- A total of 19 counties increased life expectancy in 2016 compared to the 2015 life expectancy. The highest increase was 2.0 years in Prairie County.
- A total of 48 counties decreased life expectancy in 2016 compared to the 2015 life expectancy. The greatest decrease was 2.7 years in Calhoun County.

## INTRODUCTION

According to the National Center for Health Statistics (NCHS), life expectancy at birth represents the average number of years that the members of a particular life table cohort can expect to live at the time of birth. ${ }^{4}$

While struggling to improve health outcomes at the state level, Arkansas also faces disparities in life expectancy at the county level. Concerned with the disparity, Senator Jack Crumbly ( $16^{\text {th }}$ District) sponsored a bill in 2011 to designate counties with the lowest life expectancies in the state as Red Counties. The Red Counties were defined as counties where the life expectancy at birth was more than six years below the county with the highest life expectancy than the county with the highest life expectancy. ${ }^{1}$

Acts $790^{1}$ and $798^{5}$ were passed in the Arkansas Legislature in 2011 to encourage state agencies and organizations to make appropriate services/programs available to improve public health in these counties. Following the directives of the legislation, the Red County Action Planning Committee (RCAPC) was formed in October 2012. Several agencies, including the Arkansas Department of Health (ADH), continue to work collaboratively with the RCAPC to plan and implement interventions in the 17 Red Counties identified from the 2008 data.

In this 2018 report, 22 Red Counties have been identified. Life expectancy was calculated using 2015-2017 Arkansas resident death data and 2016 Arkansas population estimates. Categories for defining life expectancy are determined based on Act $798^{5}$ using Gold (79.7 years), non-Red (73.8-79.6), and Red ( $<73.8$ ) as depicted in the map on page 5. The Gold category represents the county with the highest life expectancy and the Red category represents counties that fall more than six years below the county with the highest life expectancy.

Twenty-two Red County Profiles, as well as a profile for Benton County for comparison, were created using data on eight demographic characteristics and 29 health, social/economic and environmental factors. These data were obtained from the U.S. Census Bureau, the ADH, Centers for Disease Control and Prevention (CDC) Wonder, and the County Health Rankings \& Roadmaps. The Red County Profiles will assist the readers in understanding the issues related to health outcomes and behaviors, access to care, socio-economic factors, and physical/environmental conditions in these counties that may directly or indirectly lead to premature death.

## 2016 LIFE EXPECTANCY AT BIRTH MAP

## 2015-2017 Death Data and 2016 Population Estimates In Accordance with Act 790 and Act 798 of 2011

## SUMMARY OF RESULTS

The following four tables (pp. 7-11) and two figures (pp. 12-13) illustrate life expectancies in the U.S., the state of Arkansas, and the 75 counties in Arkansas.

- Table 1 presents 2016 life expectancies at the national and state levels. Arkansas counties with the highest and lowest life expectancies are also shown.
- While Arkansas's life expectancy was lower than the national average, Benton County, located in the northwest region of Arkansas, exceeded the national average.
- Benton County had the highest life expectancy of 79.7 years.
- Monroe County had the lowest life expectancy of 70.6 years; 9.1 years less than Benton County.
- Table 2 presents 2016 life expectancies of 22 Red Counties ranging from 70.6 to 73.7 years.
- Table 3 presents 2016 life expectancies of all counties other than the Gold and Red Counties, ranging from 73.8 to 79.6 years.
- Table 4 presents changes in life expectancies by county from 2008 to 2016.
- A total of 19 counties increased life expectancies in 2016, from the previous year, ranging from as low as 0.1 year (Baxter, Dallas and Stone Counties) to a high of 2.0 years (Prairie County).
- The life expectancies for 48 counties decreased in 2016, from the previous year, ranging from 0.1 (Sebastian, White, Boone, and Ouachita Counties) to 2.7 years (Calhoun County).
- The life expectancies of eight counties (Arkansas, Faulkner, Garland, Lawrence, Montgomery, Perry, Pope, and Pulaski) remained the same.
- Figure 1 presents life expectancy trends by gender and race for the state of Arkansas, 20072016. There has been an overall increasing trend of life expectancies among black males and females as well as white males. However, there has been a slight decrease among all race and gender groups in the last three years.
- Figure 2 presents life expectancy trends from 2013-2016 by gender and race for the Red Counties combined. As was seen in the previous graph, life expectancy has been decreasing among white and black males in the Red Counties. The disparity in life expectancies between black and white females has become smaller and have become nearly similar.

## LIFE EXPECTANCY AT BIRTH BY COUNTY

Table 1: Comparing U.S., Arkansas State, and Arkansas Counties with the Highest and Lowest Life Expectancies

| Location | Population 2016 | Life Expectancy (Years) |
| :--- | ---: | :---: |
| United States | $\mathbf{3 2 3 , 4 0 5 , 9 3 5}$ | $\mathbf{7 8 . 6}$ |
| State of Arkansas | $\mathbf{2 , 9 8 8 , 2 3 1}$ | $\mathbf{7 5 . 8}$ |
| Benton County (highest life expectancy) | 258,704 | 79.7 |
| Monroe County (lowest life expectancy) | 7,235 | 70.6 |

Table 2: Red Counties Life Expectancies

| County (n=22) | Population 2016 | Life Expectancy (Years) |
| :--- | ---: | ---: |
| Howard | 13,438 | 73.7 |
| Hot Spring | 33,446 | 73.6 |
| Ouachita | 24,019 | 73.6 |
| Nevada | 8,374 | 73.6 |
| Crittenden | 49,320 | 73.6 |
| Little River | 12,430 | 73.6 |
| Lawrence | 16,639 | 73.6 |
| Chicot | 10,912 | 73.4 |
| Cleveland | 8,260 | 73.4 |
| Sharp | 17,138 | 73.4 |
| Bradley | 10,979 | 73.4 |

## GENDER AND RACE, RED COUNTIES

Figure 2: Life Expectancy at Birth by Gender and Race Red Counties*, 2013-2016

*Includes only those counties identified as Red Counties in that particular data year and are not comparable from year to year. Source: Health Statistics Branch, Arkansas Department of Health

## DISCUSSION

Arkansas's average life expectancy for 2016 was similar to that of 2015, 75.8 and 76.0, respectively. The gap between the highest and the lowest ranking counties narrowed from 10 years in 2008 to 8.3 years in 2011, and 8.2 years in 2015 . However, the gap widened to 9.1 in 2016, which demonstrates a decreasing trend in life expectancy that has been seen throughout the nation for the last three years. Many theorists have postulated as to the reasons for this, but the generally accepted reason is that we need to invest in health rather than health care. Investing in health refers to public investments in things such as education, transportation, and housing which would directly affect the quality of life of everyone in the community. When we invest in health, we can curb the current epidemics or at least prevent the rise of new ones. ${ }^{6}$

Although there has been a slight decline in the overall life expectancy, in the past 20 years, life expectancies gradually increased for both black males and females as well as for white males. Life expectancy for black males in the U.S. increased from 64.5 years in 1990 to 72.2 years in 2015. ${ }^{4}$ Similar trends were observed for blacks in Arkansas from 2007 through 2016.

Health profiles of Benton County and the 22 Red Counties were developed (pages 16-38) using 37 measures derived from the U.S. Census Bureau, the ADH, CDC Wonder, and the County Health Rankings \& Roadmaps. These indicators were related to demographic characteristics (eight), health outcomes (seven), health behaviors (five), clinical care (five), social and economic factors (nine), and physical environmental factors (three). According to CDC, social determinants of health impacts a community. Conditions in the places where people live, learn, work, and play affect a wide range of health risks and outcomes. ${ }^{7}$ Appendix 2 provides justification for selection of these measures as well as sources of data.

A review of the statewide data reveals that Monroe County was ranked at the bottom for premature death rate. Monroe County also ranked the worst for children in single parent homes. Phillips County ranked the worst for children in poverty, adult obesity, homicide rate, and diabetes prevalence. Bradley County ranked the worst for severe housing problems. Phillips County ranked second to the worst for severe housing problems, teen birth rate, and violent crime rate. Crittenden County ranked worst for violent crime rate and second worst for low birth weight births. Jefferson County ranked worst for chlamydia infections and second worst for homicide rate. Desha County ranked worst for low birth weight births. Lawrence County ranked worst for infant mortality. St. Francis County ranked worst for teen birth rate, Lafayette County for physical inactivity, Drew County for smoking prevalence, Pulaski County for air pollution, Columbia County for alcohol-impaired driving deaths, and Lawrence County for injury mortality.

Seven of the counties mentioned above are among the 22 Red Counties identified in 2018. The rankings are indicative of the fact that, despite the gradual improvement of life expectancy in Arkansas, significant challenges exist in the Red Counties concerning health outcomes, health behaviors, socio-economic, and environmental factors that affect the length and quality of life.

Red County Report-May 2020

## APPENDIX 1: 2015 Life Expectancy at Birth Map

## 2014-2016 Death Data and 2015 Population Estimates In Accordance with Act 790 and Act 798 of 2011

State Mean $=76.0$
Minimum $($ Poinsett \& Phillips County $)=71.3$; Maximum $($ Benton County $)=79.5$

Date: September 26, 201
Source: Health Statistics Branch, Arkansas Department of Health Map created by: Joyce Biddle

## APPENDIX 2: Selection of Health Measures

## HEALTH OUTCOMES

Measuring premature mortality focuses attention on deaths that could have been prevented. Measuring Years of Potential Life Lost (YPLL) allows communities to target resources to highrisk areas and further investigate the causes of premature death. YPLL is a widely used measure of the rate and distribution of premature mortality. The measure was introduced mainly because simple mortality rates do not fully address the issue of premature death, the impact of disease and death, and their costs to society.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch
Diabetes is an important marker for a range of health behaviors. Diabetes can cause serious health complications including heart disease, blindness, kidney failure, and lower-extremity amputations. Diabetes was the seventh leading cause of death in the United States for 2017. ${ }^{8}$ Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch, BRFSS County Estimates

Human Immunodeficiency Virus (HIV) is also an important marker for a range of risky health behaviors and it can put significant burden on the population and the health care system.
Through the surveillance of HIV, a data system can be developed that combines information on HIV infection, disease progression, and behaviors and characteristics of people at high risk. With this system, CDC can direct HIV prevention funding to where it is needed the most. ${ }^{9}$
Profile Measure Data Source: Arkansas eHARS (enhanced HIV/AIDS Reporting System)
Chlamydia is the most common bacterial Sexually Transmitted Infection (STI) in North America and is one of the major causes of tubal infertility, ectopic pregnancy, pelvic inflammatory disease, and chronic pelvic pain. STIs are associated with a significantly increased risk of morbidity and mortality, including increased risk of cervical cancer, involuntary infertility, and premature death. STIs also create a high economic burden on society. ${ }^{10}$
Profile Measure Data Source: Arkansas PRISM (Patient Reporting Investigating Surveillance Manager)
Low birth weight (LBW) represents three types of risk factors: maternal exposure to health risks and an infant's current and future morbidity, as well as premature mortality risk. From the perspective of maternal health outcomes, LBW indicates maternal exposure to health risks in all categories of health factors, including her health behaviors, access to health care, the social and economic environment she inhabits, and environmental risks to which she is exposed. In terms of the infant's health outcomes, LBW serves as a predictor of premature mortality and/or morbidity over the life course and for potential cognitive development problems.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch Query System
Teen Births are the number of births per 1,000 female population, ages 15-19. Evidence suggests teen pregnancy significantly increases the risk of repeat pregnancy and of contracting a STI, both of which can result in adverse health outcomes for mothers, children, families, and communities. Pregnant teens are more likely than older women to receive late or no prenatal care, have gestational hypertension and anemia, and achieve poor maternal weight gain. Teens
are also more likely than older women to have a pre-term delivery and LBW baby, increasing the risk of child developmental delay, illness, and mortality.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch Query System
Infant mortality represents the health of the most vulnerable age group (those under 365 days) and can help with interpreting the years of potential life lost (YPLL) rate in a county. Infant mortality is also commonly used to examine global health differences, as well as to understand historic racial inequities in the U.S.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch Query System

## HEALTH BEHAVIOR

Cigarette smoking is identified as a cause of various cancers, cardiovascular disease, and respiratory conditions, as well as LBW and other adverse health outcomes. Measuring the prevalence of tobacco use in the population can alert communities to potential adverse health outcomes and can be valuable for assessing the need for cessation programs or the effectiveness of existing programs.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch, BRFSS County Estimates
Obesity is often the result of an overall energy imbalance due to poor diet and limited physical activity. Obesity increases the risk for health conditions such as coronary heart disease, type 2 diabetes, cancer, hypertension, dyslipidemia, stroke, liver and gallbladder disease, sleep apnea and respiratory problems, osteoarthritis, and poor health status.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch, BRFSS County Estimates
Decreased physical activity has been related to several disease conditions such as type 2 diabetes, cancer, stroke, hypertension, cardiovascular disease, and premature mortality, independent of obesity. Physical inactivity causes $11 \%$ of premature mortality in the U.S. In addition, physical inactivity is related to health care expenditures for circulatory system diseases. Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch, BRFSS County Estimates

Excessive drinking is a risk factor for a number of adverse health outcomes such as alcohol poisoning, hypertension, acute myocardial infarction, sexually transmitted infections, unintended pregnancy, fetal alcohol syndrome, sudden infant death syndrome, suicide, interpersonal violence, and motor vehicle crashes. Excessive drinking is the third leading lifestyle-related cause of death in the U.S.
Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
Alcohol-impaired driving deaths directly measures the relationship between alcohol and motor vehicle crash deaths. In 2017, approximately 10,900 Americans were killed in alcohol-related motor vehicle crashes. The annual cost of alcohol-related crashes totals more than $\$ 44$ billion. Drivers between the ages of 21 and 24 cause $27 \%$ of all alcohol-impaired deaths. ${ }^{11}$ Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings

## CLINICAL CARE

Lack of health insurance coverage is a significant barrier to accessing needed health care and to maintaining financial security. One key finding from the Kaiser Family Foundation report on access to healthcare is that, "Going without coverage can have serious health consequences for the uninsured because they receive less preventative care, and delayed care often results in serious illness or other health problems. Being uninsured can also have serious financial consequences, with many unable to pay their medical bills, resulting in medical debt." ${ }^{12}$ Profile Measure Data Source: United States Census Bureau, American Community Survey

Access to care requires not only financial coverage, but also, access to providers. While high rates of specialist physicians have been shown to be associated with higher, and perhaps unnecessary utilization, sufficient availability of primary care physicians is essential for preventive and primary care, and when needed, referrals to appropriate specialty care.

Untreated dental disease can lead to serious health effects including pain, infection, and tooth loss. Although lack of sufficient dental providers is only one barrier to accessing oral health care, much of the country suffers from shortages. According to the Health Resources and Services Administration, as of as of February 2019, there were 5,834 Dental Health Professional Shortage Areas (HPSAs), with 58 million people total living in them. ${ }^{13}$

Health care costs are an important measure of the efficiency of a health care system. Health care costs are the price-adjusted Medicare reimbursements (Parts A and B) per enrollee. However, in order to rank a measure, an ideal value must be known. Research shows that 'too little' or 'too much' health care spending is not good for health care outcomes. However, it is not yet known what the 'ideal' level of spending on patients should be.
Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
Preventable hospital stays is the hospital discharge rate for ambulatory care-sensitive conditions per 1,000 fee-for-service Medicare enrollees. Ambulatory care-sensitive conditions include: convulsions, chronic obstructive pulmonary disease, bacterial pneumonia, asthma, congestive heart failure, hypertension, angina, cellulitis, diabetes, gastroenteritis, kidney/urinary infection, and dehydration. Hospitalization for diagnoses treatable in outpatient services suggests that the quality of care provided in the outpatient setting was less than ideal. The measure may also represent a tendency to overuse hospitals as a main source of care.

## SOCIAL \& ECONOMIC FACTORS

Median household income is the income at which half the households earn more and half the households earn less. Median household income is a well-recognized indicator of income and poverty.
Profile Measure Data Source: United States Census Bureau, American Community Survey

The unemployed population experiences worse health and higher mortality rates than the employed population. Unemployment has been shown to lead to an increase in unhealthy behaviors related to alcohol and tobacco consumption, diet, exercise, and other health-related behaviors, which in turn can lead to increased risk for disease or mortality, especially suicide. Because employer-sponsored health insurance is the most common source of health insurance coverage, unemployment can also limit access to health care.
Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
Poverty can result in an increased risk of mortality, prevalence of medical conditions and disease incidence, depression, intimate partner violence, and poor health behaviors. A 1990 study found that if poverty were considered a cause of death in the U.S., it would rank among the top 10 causes. While negative health effects resulting from poverty are present at all ages, children in poverty experience greater morbidity and mortality than adults due to increased risk of accidental injury and lack of health care access.
Profile Measure Data Source: United States Census Bureau, American Community Survey
Adults and children in single parent households are at risk for adverse health outcomes such as mental health problems (including substance abuse, depression, and suicide) and unhealthy behaviors such as smoking and excessive alcohol use. Self-reported health has been shown to be worse among lone parents (male and female) than for parents living as couples, even when controlling for socioeconomic characteristics. Mortality risk is also higher among lone parents. Children in single parent households are at greater risk of severe morbidity and all-cause mortality then their peers in two-parent households.
Profile Measure Data Source: United States Census Bureau, American Community Survey
Not only does one's education level affect his or her health, education can have multigenerational implications that make it an important measure for the health of future generations. Evidence links maternal education with the health of her offspring. Parents' level of education affects their children's health directly through resources available to the children, and also indirectly through the quality of schools that the children attend.
Profile Measure Data Source: United States Census Bureau, American Community Survey
The relationship between higher education and improved health outcomes is well known, with years of formal education correlating strongly with improved work and economic opportunities, reduced psychosocial stress, and healthier lifestyles.
Profile Measure Data Source: United States Census Bureau, American Community Survey
Homicides are the number of deaths from assaults. Homicide has been ranked as one of the top five leading causes of death each year for persons aged 1-45 years living in the United States. Homicide is an extreme outcome of the broader public health problem of interpersonal violence. Despite the promising decrease in certain homicide rates, primary prevention efforts against violence should be increased, particularly among young racial/ethnic minority males.
Profile Measure Data Source: Arkansas Department of Health, Health Statistics Branch Query System
High levels of violent crime compromise physical safety and psychological well-being. High crime rates can also deter residents from pursuing healthy behaviors such as exercising outdoors.

Exposure to crime and violence has been shown to increase stress, which may exacerbate hypertension and other stress-related disorders and may contribute to obesity prevalence. Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings

Injuries are one of the leading causes of death. Unintentional injuries were the $3^{\text {rd }}$ leading cause and intentional injuries the $10^{\text {th }}$ leading cause of U.S. mortality in 2017. ${ }^{14}$ The leading causes of death among unintentional injuries, respectively were: poisoning, motor vehicle traffic, and falls. Among intentional injuries the leading causes of death are: suicide by firearm, suicide by suffocation, and homicide by firearm, respectively. In 2017, Unintentional injuries were the leading cause of death for all groups under age 45. Injuries account for $28 \%$ of all emergency department visits, and falls account for over one-third of those visits. ${ }^{15}$

## PHYSICAL ENVIRONMENTAL FACTORS

The relationship between elevated air pollution, particularly fine particulate matter and ozone, and compromised health has been well documented. Negative consequences of ambient air pollution include decreased lung function, chronic bronchitis, asthma, and other adverse pulmonary effects.
Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
Recent studies estimate that contaminants in drinking water sicken 1.1 million people each year. Ensuring the safety of drinking water is important to prevent illness, birth defects, and death among those with compromised immune systems. A number of other health problems have been associated with contaminated water, including nausea, lung and skin irritation, cancer, kidney, liver, and nervous system damage.
Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
Good health depends on having homes that are safe and free from physical hazards. When adequate housing protects individuals and families from harmful exposures and provides them with a sense of privacy, security, stability and control, it can make important contributions to health. In contrast, poor quality and inadequate housing contributes to health problems such as infectious and chronic diseases, injuries and poor childhood development. Profile Measure Data Source: University of Wisconsin Population Health Institute, 2017 County Health Rankings
